### About Impala workload management

Cloudera Data Warehouse (CDW) Public Cloud provides you the option to enable logging Impala queries on an existing Virtual Warehouse or while creating a new Impala Virtual Warehouse. By logging the Impala queries in CDW, you gain increased observability of the workloads running on Impala, which you can use to improve the performance of your Impala Virtual Warehouses.

**Note**: This feature is in technical preview and not recommended for use in production deployments. Cloudera recommends that you try this feature in test and development environments.

This feature significantly enhances the query profiling capabilities. You can have Impala archive crucial data from each query's profile into dedicated database tables, namely the query history table and live query table. These tables are part of the sys database and are designed to store valuable information that can later be queried using any Impala client, providing a consolidated view of reports from previously executed queries.

The query history table, sys.impala\_query\_log, proves particularly useful when dissecting workloads for in-depth analysis of query performance. Unlike the limitations associated with query profiles, which are only available to the client that initiated the query, the query history table offers a comprehensive solution for querying completed queries without the need to parse the text of each query profile. Additionally, the query history table provides a comprehensive view across all Impala coordinators.

The Impala query information is stored indefinitely in the sys.impala\_query\_log table whereas the sys.impala\_query\_live table reflects the in-memory state of all Impala coordinators. Actively running and recently completed queries are stored in the sys.impala\_query\_live table. Data is removed from this table once it is persisted in the sys.impala\_query\_log table or if the coordinator is restarted. Therefore, it is possible that some of the records are momentarily duplicated in both these tables.

Because the sys.impala\_query\_live table is stored only in memory, recently completed queries that still need to be persisted to the sys.impala\_query\_log table are lost if the coordinator crashes. However, if the coordinator shuts down gracefully, then the recently completed queries are stored in the sys.impala\_query\_log table and are not lost.

## Table format

The Impala query history and live query system tables contain the following columns:

#### CLOUDERA TECHNICAL PREVIEW DOCUMENTATION

| Column Name                      | Description  | Data Type | Sample Value                          |
|----------------------------------|--|-----------|---------------------------------------|
| cluster_id                       | String specified<br>through the Impala<br>startup flag to<br>uniquely identify an<br>instance    | string    | cluster-123                           |
| query_id                         | Impala assigned<br>query identifier  | string    | 214d08bef0831e7a:3<br>c65392400000000 |
| session_id                       | Impala assigned session identifier   | string    | ea4f661af43993d8:5<br>87839553a41adb8 |
| session_type                     | Client session type  | string    | HIVESERVER2                           |
| hiveserver2_protocol_<br>version | Version of the<br>HiveServer (HS2)<br>protocol that was<br>used by the client<br>when connecting | string    | HIVE_CLI_SERVICE_P<br>ROTOCOL_V6      |
| db_user                          | Effective user on the cluster  | string    | csso_name                             |
| db_user_connection               | Username from an authenticated client  | string    | csso_name                             |
| db_name                          | Name of the<br>database being<br>queried   | string    | default                               |
| impala_coordinator               | Name of the<br>coordinator for the<br>query  | string    | coord-22899:27000                     |
| query_status                     | Status of the query when it completes  | string    | ОК                                    |
| query_state                      | Final state of the query   | string    | FINISHED                              |
| impala_query_end_st<br>ate       | Final Impala state of the query  | string    | FINISHED                              |
| query_type                       | Type of the query  | string    | QUERY                                 |
| network_address                  | Client IP address and port   | string    | 127.0.0.1:40120                       |

| [                                |   |               | []   |
|----------------------------------|---|---------------|--|
| start_time_utc                   | Time when the query<br>started. Time zone is<br>in UTC  | timestamp     | 2024-07-17<br>17:13:46.414316000   |
| total_time_ms                    | Difference between<br>the query end time<br>and start time, in<br>milliseconds                                      | decimal(18,3) | 136.121  |

|----------------------------|--|--------|--|
| bytes_read_cache_tot<br>al | Total bytes read from the data cache   | bigint | 45823  |
| bytes_read_total           | Total bytes read   | bigint | 745227   |
| pernode_peak_mem_<br>min   | Minimum value of all<br>the per-node peak<br>memory usages                             | bigint | 5552846  |
| pernode_peak_mem_<br>max   | Maximum value of all<br>the per-node peak<br>memory usages                             | bigint | 5552846  |
| pernode_peak_mem_<br>mean  | Mean value of all the<br>per-node peak<br>memory usages                                | bigint | 5552846  |
| sql                        | SQL statement as provided by the user  | string | SELECT db_user,<br>total_time_ms from<br>impala_query_log<br>where query_state =<br>'EXCEPTION'; |
| plan                       | Full text of the query plan  | string |  |
| tables_queried             | Comma-separated<br>string containing all<br>the tables queried in<br>the SQL statement | string |  |

### Use cases

A consolidated view of reports from previously executed queries can be useful in the following use cases:

- For collecting the history of all queries run and reported by a user or by date and time **Example**: SELECT db\_user, start\_time, end\_time, total\_time\_ms, sql from impala query log order by db user;
- For collecting the frequently-run queries
   Example: SELECT db\_user, query\_status, query\_state, sql from impala\_query\_log where query\_state = 'EXCEPTION';
- For reporting queries that are running over 10 minutes

```
Example: SELECT db_user, total_time_ms, sql from impala_query_log
where total_time_ms > 600000;
```

### How Impala workload management works

To use this feature, enable Impala query logging while creating a new Virtual Warehouse or by editing an existing one by selecting the **Log Impala Queries (Preview)** option. By default, the **Log Impala Queries (Preview)** option is off.

You can then configure the Impala coordinator using specific startup flags to store query history. Impala manages the table serving as a centralized repository for all query histories across databases. Completed queries are periodically inserted into this table based on a preconfigured interval.

This feature streamlines the process of query history management, providing a more accessible and comprehensive way to analyze and retrieve information about completed queries

**Note:** This feature is available only on CDW running Impala image versions 2024.0.18.0 and higher.

Important: The following query types are not written into the query logging tables:

- SET
- SHOW
- USE
- DESCRIBE

### Impala coordinator startup flags

Each Impala coordinator runs an SQL statement on startup to create the query logging tables. The following table lists the Impala startup coordinator flags that you can configure:

| Name                              | Data Type           | Default | Description   |
|-----------------------------------|---------------------|---------|---|
| cluster_id                        | string              |         | Specifies an identifier string that uniquely<br>represents this cluster. This identifier is<br>included in both tables and is used as a<br>table partition for the<br>sys.impala_query_log table. |
| query_log_shutdown_deadlin<br>e_s | number<br>(seconds) | 30      | Hidden flag. Number of seconds to wait<br>for the queue of completed queries to be<br>carried into the query history table before<br>timing out and continuing the shutdown                       |

|                            |                     |          | ,   |
|----------------------------|---------------------|----------|---|
|                            |                     |          | process.<br>The query history table drain process<br>runs after the shutdown process<br>completes, therefore the max shutdown<br>time is extended by the value specified in<br>this flag.   |
| workload_mgmt_user         | string              | impala   | Specifies the user that will be used to insert records into the query history table.  |
| query_log_write_interval_s | number<br>(seconds) | 300      | Number of seconds to wait before<br>inserting completed queries into the<br>query history table. Allows for batching<br>inserts to help avoid small files.  |
| query_log_max_queued       | number              | 5000     | Maximum number of completed queries<br>that can be queued before they are<br>written to the query history table.<br>This flag operates independently of the<br>'query_log_write_interval_m' flag. If the<br>number of queued records reaches this<br>value, the records will be written to the<br>query log table no matter how much time<br>has passed since the last write.<br>A value of 0 indicates no maximum<br>number of queued records. |
| query_log_max_sql_length   | number              | 16777216 | Maximum length of an SQL statement<br>that will be recorded in the completed<br>queries table.<br>If an SQL statement with a length longer<br>than this specified value is executed, the<br>SQL inserted into the completed queries<br>table will be trimmed to this length.<br>Any characters that require escaping will<br>have their backslash character counted<br>towards this limit.  |
| query_log_max_plan_length  | number              | 16777216 | Maximum length of the SQL query plan<br>that will be recorded in the completed<br>queries table. If a query plan has a length<br>longer than this value, the plan inserted<br>into the completed queries table will be<br>trimmed to this length.   |

|                        |        | Any characters that require escaping will<br>have their backslash character counted<br>towards this limit.                         |
|------------------------|--------|--|
| query_log_request_pool | string | Specifies a pool or queue used by the<br>queries that insert into the query log<br>table.<br>Empty value causes no pool to be set. |

### Known Issue

 $\underline{\text{DWX-18554}}$ : You cannot access the <code>sys.impala\_query\_live</code> table when Impala cannot schedule the query.

Workaround: None.
